 To optimize the processing of natural gas, accurate thermodynamic data are required. Here, we investigate the quality of the physically based BACKONE equation of state, which requires only 3?5 substance specific parameters for each pure component. For mixtures, only one mixture parameter for each binary and no ternary parameters are required.

In general, thermodynamic properties can be divided into two general classes: Extensive properties: An extensive property is dependent upon the amount of mass present or upon the size or extent of a system. For example, the following properties are extensive: Enthalpy; Entropy; Gibbs Free Energy; Heat Capacity; Internal Energy; Mass; Volume

However, highly accurate data for thermodynamic properties at liquid states of the relevant systems are rare. While most properties can be determined at liquid states with higher accuracy than at gaseous or supercritical states for pure fluids, it is difficult to determine the exact composition of the liquid in the measuring cell for the mixtures considered here.

While this can be a valid assumption for mixtures of fully miscible and similarly sized molecules, it may not hold accurate when studying, e.g., thermodynamic properties of large solvated molecules such as typical outer-sphere electrochemically active complexes, liquid mixtures where the difference in size of the various molecules is pronounced, and fully immiscible or partially immiscible liquids.

Originating from the energy engineering sector, FluidProp provides fluid models that are accurate over a wide range of temperatures and pressures, thus for many oil&gas and chemical processes. It usually outperforms any other fluid-property code when it comes to speed of execution thanks to its advanced algorithms.

Thermodynamic properties and relations In order to carry through a program of finding the changes in the various thermodynamic functions that accompany reactions—such as entropy, enthalpy, and free energy—it is often useful to know these quantities separately for each of the materials entering into the reaction.

Thermodynamic properties. Thermodynamic properties are the characteristics (identifiable and observable) of a system by which it can be specified. For example: mass, volume, temperature, pressure etc. Thermodynamic properties can be divided into two groups. Extensive properties. Intensive properties.

Pressure, volume, and temperature (PVT) are the most fundamental thermodynamic properties of matters because they can be relatively easily measured and are intrinsically related to other thermodynamic parameters [1,2].

This accurate modeling of thermodynamic properties is particularly important in the separation of non-ideal mixtures, and ASPEN has a large data bases of regressed parameters. ASPEN can handle very complex processes, including multiple-column separation systems, chemical reactors, distillation of chemically reactive compounds, and even electrolyte solutions like mineral acids and sodium hydroxide solutions.
