In SAS testing linear hypotheses about the regression coefficients is done using a Wald test. To use the built in SAS option just add test statements for all the hypothesis that needs to be tested. The partial deviance can be used by running the full and reduced model for each hypothesis and then taking each model and comparing this difference to the appropriate chi-square distribution.

The essential introduction to the theory and application of linear models linear models new edition. Since most advanced statistical tools are generalizations of the linear model, it is neces-sary to first master the linear model in order to move forward to more advanced concepts. The linear model remains the main tool of the applied statistician and is central to the training of any statistician regardless of whether the focus is applied or theoretical.

Cluster analysis or clustering is the task of grouping a set of objects in such a way that objects in the same group (called a cluster) are more similar (in some sense) to each other than to those in other groups (clusters). It is a main task of exploratory data mining, and a common technique for statistical data analysis, used in many fields, including pattern recognition, image analysis ...
