The bench aids for malaria microscopy is a set of 12 plastic laminated A4-size plates produced as aids for the microscopic diagnosis of human malaria. They are intended for use as both a practical tool for health workers engaged in the routine diagnosis of malaria infections and a teaching aid for students and trainees.

Bench Aids for the diagnosis of malaria infections Preparation of thick and thin blood films on the same slide For routine malaria microscopy, thin and thick blood films are made On the same slide. The thin film is used as a label but, if we prepared, is also available for species confirmation. Examination should be done On a thick film.

Malaria in the Endemic setting: Geography and Disease Burden. Malaria is endemic in 106 countries and accounted for 655 000 deaths in 2010, 86% of which occurred among children []. Plasmodium falciparum (the most lethal species) is by far the predominant species in tropical regions. Plasmodium vivax (tolerant to lower ambient temperatures still facilitating replication in the vector) is mainly ...

The parasite density was calculated from the thick smear as indicated in the World Health Organization (WHO) Bench aids for malaria microscopy by counting the number of parasites against 200 leukocytes (assuming that there are 8,000 leukocytes/ μ L), and it was expressed as parasites per microliter. 6
