protocol that makes the internet work. BGP is short for Border Gateway Protocol and it is the routing protocol used to route traffic across the internet. Routing Protocols (such as BGP, OSPF, RIP, EIGRP, etc...) are designed to help routers advertise adjacent networks and since the internet is a network of networks, BGP helps to propagate these networks to all BGP Routers across the world.

Gateway Protocol (BGP Protocol). It is one of the most important protocols to make the Internet work the way it works. It is used mainly in two scenarios: Between ISP (Internet Service Provider) - ISP connect with at least one or more of other ISP and exchange all of their Public IP Routing information. This makes possible the connectivity around the globe for all the internet users.

IP Routing: BGP Configuration Guide - Cisco - Border Gateway Protocol - Border Gateway Protocol (BGP) BGP is a standardized exterior gateway protocol (EGP), as opposed to RIP, OSPF, and EIGRP which are interior gateway protocols (IGP's). BGP Version 4 (BGPv4) is the current standard deployment. BGP is considered a "Path Vector" routing protocol. BGP was not built to
