Macromolecules Are Formed When Monomers Are Linked Together To Form Longer Chains Called Polymers. The Same Process Of Making And Breaking Polymers Is Found In All Living Organisms. There Are Four Macromolecules Essential To Living Matter Containing C, H, O, N And Sometimes S. Nucleic Acids And Lipids Protein Carbohydrates.

[Macromolecules In Biology: Definition And Types](#)

Elements & Macromolecules in Organisms (2.3) Most common elements in living things are carbon, hydrogen, nitrogen, and oxygen. These four elements constitute about 95% of your body weight. All compounds can be classified in two broad categories --- organic and inorganic compounds. Organic compounds are made primarily of carbon.

[Elements & Macromolecules in Organisms \(2.3\)](#)

Biology Elements & Macromolecules in Organisms. STUDY. PLAY. Name the 4 main elements that make up 95% of an organism. Carbon, hydrogen, oxygen, and nitrogen. (CHON) What are macromolecules? Large organic molecules. Name the 4 classes of macromolecules. Carbohydrates, proteins, lipids, and nucleic acids.

[Biology Elements & Macromolecules in Organisms Flashcards](#)

A biological macromolecule is defined as a large molecule made up of smaller organic molecules, known as monomers. There are four classes of biological macromolecules, one of them being carbohydrates. Carbohydrates are made of three base elements; Carbon, Hydrogen, and Oxygen in a 1:2:1 ration. There are three different classes of carbohydrates; monosaccharides, disaccharides, andl
