a. Temperature goes up and the level of carbon dioxide goes down. This is because cellular respiration is an exergonic process that is only about 38% efficient; the remaining energy is lost to the environment as heat. Also, carbon dioxide is being converted to organic molecules such as fats and sugars during cellular respiration. b.

In Chapter 9, students will learn how cellular respiration and fermentation provide organisms with the energy they need to survive. Students will show this understanding by interpreting multiple, detailed ? gures. They will also practice their data analysis skills by collecting and interpreting data on the byproducts of cellular respiration.
