Collision theory. There are several factors which change the rate of reaction. One big idea links them all - collision theory. For two particles to react, they have to collide in the right orientation and with enough energy to break the atomic bonds in the particles. The more frequently these collisions happen, the faster the rate of reaction will be.

The postulates of collision theory are accommodated in the Arrhenius equation. The frequency factor A is related to the rate at which collisions having the correct orientation occur. The exponential term,  $e^{-E_a / RT}$ , is related to the fraction of collisions providing adequate energy to overcome the activation barrier of the reaction.
