Combinatorics is the study of finite sets of objects defined by certain specified properties - combinatorial structures - such as: ISubsets of a finite set  $\emptyset, \{1\}, \{2\}, \{3\}, \{1,2\}, \{1,3\}, \{2,3\}, \{1,2,3\}$  IPartitions of a number  $4 = 1+1+1+1 = 1+1+2 = 1+3 = 2+2$ . IWords over a finite alphabet  $aaa, aab, aba, abb, baa, bab, bba, bbb$ .~~

Combinatorial Algorithms: Theory and Practice. By E. M. REINGOLD, J. NIEVERGELT and N. DEO. Prentice-Hall, Englewood Cliffs, NJ, 1977, \$18.95. The term "combinatorial algorithms" usually means the performance of numerical  
computations with sets of discrete structures of one kind or another.

The problem occupies a rare position in the world of complexity theory, it is clearly in NP but is not known to be in P and it is not known to be NP-complete. Many sub-disciplines of mathematics, such as topology theory  
and group theory, can be brought to bear on the problem, and yet only for special classes of graphs have polynomial-time algorithms been discovered.

Combinatorial optimization is a subfield of mathematical optimization that is related to operations research, algorithm theory, and computational complexity theory. It has important applications in several fields,  
including artificial intelligence, machine learning, auction theory, software engineering, applied mathematics and theoretical computer science. Combinatorial optimization is a topic that consists of finding an optimal  
object from a finite set of objects. In many such problems, exhaust
