246 Engineering noise control Figure 10.1. Desired noise spectrum for an overall level of 90 dB(A). To adequately define the noise problem and set a good basis for the control strategy, the following factors should be considered: type of noise noise levels and temporal pattern frequency distribution noise sources (location, power, directivity)

The practice of engineering noise control demands a solid understanding of the fundamentals of acoustics, the practical application of current noise control technology and the underlying theoretical concepts. This fully revised and updated fourth edition provides a comprehensive explanation of these key areas clearly, yet without oversimplification.

Since the late 1940s, scientists and engineers have been working on ways to control noise from machinery. In the 1970s, the emphasis was on engineering controls in the workplace, but since then the focus has shifted because OSHA has not enforced the requirement for engineering controls and because industry leaders have failed to take into account the risk to hearing when purchasing equipment.

Engineering Controls for Reducing Workplace Noise

Noisy processes in engineering A person's overall noise exposure may come directly from an individual machine, but noise from other machinery or processes elsewhere in the workshop may also...

Noise Control Engineering (NCE) is a premier acoustical engineering consulting firm that specializes in noise and vibration measurement and control for marine, industrial and commercial applications. Founded in 1991 by Raymond Fischer, NCE is a Small Business that readily responds to client needs. We have the experience, tools and innovative ideas to provide cost-effective solutions to all types of acoustical problems.

NCEJ is the pre-eminent academic journal of noise control. It is the International Journal of the Institute of Noise Control Engineering of the USA. It is also produced with the participation and assistance of the Korean Society of Noise and Vibration Engineering (KSNVE). NCEJ reaches noise control professionals around the world, covering over 50 national noise control societies and institutes.

Noise control engineering is concerned with the application of basic acoustics and vibration theory to reduce noise in practical situations. The noise control engineer needs to know how to set targets, how to characterise and quantify noise sources, and how to reduce noise either at source or, more commonly, in the transmission path.

One of the first means of engineering controls is to interrupt the path of the noise from the source to the worker. This is best achieved where higher frequencies are involved by blocking the path through acoustical insulation that is effective for a specific frequency range.

Designer-NOISE® is a software program designed to allow for quick and accurate predictions of noise levels on surface ships and other stiffened plate structures. Octave-band and overall A-weighted noise levels are calculated based on sound propagation from machinery, propeller, and wave slap sources via airborne and structureborne paths.

The exposure to noise can be reduced by eliminating the source of noise (if possible), substituting the source with a quieter one, applying engineering modifications, using administrative controls, and by using protective equipment. The best way to reduce exposure to noise is to engineer it out at the design stage.
