Error Control Coding For Computer
A very poorly written banking system could potentially result in your bank balance being changed if just one of the bits in a number was changed by a cosmic ray affecting a value in the computer's memory! If the barcode on the packet of chips you buy from the shop is scanned incorrectly, you might be charged for shampoo instead.

In the interactive, the computer has a 7x7 grid of black and white cards. You must choose the colour of an extra card for each row (at the right) and column (at the bottom), making an 8x8 grid of cards.

Error Control Coding For Computer Systems Prentice Hall ...
An error control coding algorithm can often detect errors more easily than it can correct them. Errors involving multiple bits can sometimes even go undetected. What if the computer (or your friend if you were being a magician with actual parity cards) had been sneaky and turned over two cards instead of one?

Step 1: The data sequence is divided into 'K1' words of same size 'n' (8 or 16 bits). Step 2: All words are added using 1's complement addition and the sum is computed. Step 3: The sum is complemented, if it is 0, the data is error - free and is accepted; otherwise the received data is...

The magic in the trick is actually computer science, using the same kind of technique that computers use to detect and correct errors in data. We will talk about how it works in the next section. The same thing is happening to data stored on computers --- while you (or the computer) is looking away, some of it might accidentally change because of a minor fault.

Because the maximum distance (d min) of Hamming code is 3, it can be used to detect double errors or correct single error. For detecting double (2) errors => d min \geq 2+1 i.e. d min \geq 3. and for correcting upto one (1) error => d min \geq 2 (1) +1 i.e. d min \geq 3. Q.5.

CI control codes for general use. These are the most common extended control codes, and are defined in ISO/IEC 6429, ECMA-48 and JIS X 0211 (formerly JIS C 6323). If using the ISO/IEC 2022 extension mechanism, they are designated as the active C1 control character set with the sequence 0x1B 0x22 0x43 (ESC " C).
