Introduction. The European Flight Mechanics Action Group FM-AG (16) on Fault Tolerant Control, established in 2004 and concluded in 2008, represented a collaboration involving thirteen European partners from industry, universities and research establishments under the auspices of the Group for Aeronautical Research and Technology in Europe (GARTEUR) program.

These non-conventional control strategies involve the so-called concept of fault tolerant flight control (FTFC), where the control system is capable to detect and adapt for changes in the aircraft behaviour. One FTFC strategy option is using a model based control routine. This research focuses on a physical modular approach.

Fault Tolerant Flight Control: A Physical Model Approach ...

rithm is established using concepts from loss-of-control. The fault-tolerant controller is designed to operate the single control surface for lateral control and the throttle for total energy control. The fault diagnosis algorithm and the fault-tolerant controller are both designed using a model of the aircraft.

Fault-Tolerant Flight Control Using One Aerodynamic ...

- the flight control and guidance system should be reconfigurable depending on actuator fault occurrence or aircraft damage, and should be able to avoid obstacles. Fault-tolerant Flight Control and Guidance Systems addresses all of these aspects with a practical approach following three main requirements: being applicable in real-time; highly computationally efficient; and modular.

Microsoft Flight Simulator was used as a test platform to generate input data and to demonstrate successful operation by showing a flight under control by the flight control system. The end results show that a fault tolerant system can be developed to successfully tolerate one fault while the system is in operation.

A fault tolerant control scheme for actuator and sensor faults is proposed for a tilt-rotor unmanned aerial vehicle (UAV) system. The tilt-rotor UAV has a vertically take-off and landing (VTOL) capability like a helicopter during the take-off & landing while it could cruise with a high speed as a conventional airplane flight mode.

a fault to be in some way circumvented. Flight control is a promising application area for fault-tolerant control, because aircraft, in addition to being very fully instrumented, usually have some actuator redundancy.

Fault Tolerance in Flight Control Systems by Riccardo Caimano

In this project, we design a set of fault-tolerant control algorithms to stabilize and control a quadrotor with complete loss of one or more rotors in realistic scenarios, such as withstanding significant unmodeled aerodynamic effects in high-speed flights.

Quadrotor Fault Tolerant Flight Control | Sihao Sun

In order to improve the safety of hexarotor UAV during flight, a fault-tolerant control scheme independent of basic control law and control distribution is designed in this paper. Firstly, the linear active disturbance rejection control (LADRC) was used as the basic control law for attitude control of hexarotor UAV.

Fault Tolerant Control Algorithm of Hexarotor UAV

Improvement of aircraft performance, fault tolerance, and pilot handling qualities in emergency situations are essential to reduce pilot workload and to enable high-automation systems , , . These topics, in the area of flight controller design, are generally recognized as Fault-Tolerant Flight Control (FTFC) systems . A FTFC system is a backup technique for controlling faulty or damaged aircraft in order to ensure the flight safety in such emergency situations.

The Active Fault-Tolerant Control (AFTC) is achieved through redistributing the control signals among the healthy actuators using reconfigurable multiplexing and pseudo-inverse control allocation. The Fault Detection and Isolation problem is also considered by proposing model-based and model-free modules.
