A water manometer used to measure pressure in the spinal fluid. The height of the fluid in the manometer is measured relative to the spinal column, and the manometer is open to the atmosphere. The measured pressure will be considerably greater if the person sits up. Solution (a) 13.6 m water (b) 76.5 cm water. 115.

FLUID STATICS This chapter deals with forces applied by fluids at rest or in rigid-body motion. The fluid property responsible for those forces is pressure, which is a normal force exerted by a fluid per unit area. We start this chapter with a detailed discussion of pressure, including absolute and gage

FLUID STATICS. Fluid statics is all about pressure. Here are the rules; 1. Pressure at any point in a fluid is the same in all directions and is transmitted through static fluids without loss (Pascal's principle) 2. From 1, the pressure at the wall of any vessel is perpendicular to the wall 3.

Questions & Answers - Fluid Mechanics - The Fluid Mechanic Fluid statics is the study of fluid problems in which there is no relative motion between fluid elements. With no relative motion between individual elements (and thus no velocity gradients), no shear can exist, whatever the viscosity of the fluid is. Accordingly, viscosity has no effect in static problems and exact analytical solutions to such problems are

## LECTURE NOTES - II

Fluid Statics is a branch of mechanics of fluid which deals primarily with fluids at rest. As individual elements do not move relative to each other, shear stresses are not involved and all forces due to the pressure of the fluid are normal to the surfaces on which they acts. ## Engineering Fluid Mechanics

□ In engineering applications, a fluid (sv: fluid) is a liquid or a gas □ The behaviour of stationary fluids is described by fluid statics □ A liquid in a container forms a layer with a distinct surface, and exerts forces on the walls supporting it, while a gas will fill the whole container.

## 6. Fluid mechanics: fluid statics; fluid dynamics

For a static fluid, the only stress is the normal stress since by definition a fluid subjected to a shear stress must deform and undergo motion. Normal stresses are referred to as pressure  $p$ . For the general case, the stress on a fluid element or at a point is a tensor For a static fluid, □
