**ABSTRACT** We present an indoor positioning system that measures location using disturbances of the Earth's magnetic field caused by structural steel elements in a building. The presence of these large steel members warps the geomagnetic field in a way that is spatially varying but temporally stable.

**ABSTRACT.** We present an indoor positioning system that measures location using disturbances of the Earth's magnetic field caused by structural steel elements in a building. The presence of these large steel members warps the geomagnetic field in a way that is spatially varying but temporally stable. To localize, we measure the magnetic field using an array of e-compasses and compare the measurement with a previously obtained magnetic map.

**Indoor location sensing using geo magnetism | Proceedings—**

Indoor Location Sensing Using Geo-Magnetism was active from January 2010 to January 2014. We present an indoor positioning system that measures location using disturbances of the Earth's magnetic field by structural steel elements in a building. The presence of these large steel members warps the geomagnetic field such that lines of magnetic force are locally not parallel.

**Indoor location sensing using geo magnetism**

An indoor positioning system (IPS) is a network of devices used to locate people or objects where GPS and other satellite technologies lack precision or fail entirely, such as inside multistory buildings, airports, alleys, parking garages, and underground locations.. A large variety of techniques and devices are used to provide indoor positioning ranging from reconfigured devices already ...

**Indoor Location Sensing Using Geo Magnetism Cell Phone—**

Title:Indoor Location Sensing Using Geo-Magnetism. Summary: An indoor location sensing mechanism using earth's magnetic field distortion is presented. The distortion due to metallic skeleton of a building is mapped to uniquely identify each location with the help of e-compasses. Measurement and experiment are carried over on different locations and the paper claims to achieve and accuracy of 1 m is achieved 88% of time.

Received-Signal-Strength-Based Indoor Positioning Using Compressive Sensing. Abstract: The recent growing interest for indoor Location-Based Services (LBSs) has created a need for more accurate and real-time indoor positioning solutions. The sparse nature of location finding makes the theory of Compressive Sensing (CS) desirable for accurate indoor positioning using Received Signal Strength (RSS) from Wireless Local Area Network (WLAN) Access Points (APs).
