The soroban (算盤, そろばん, counting tray) is an abacus developed in Japan. It is derived from the ancient Chinese suanpan , imported to Japan in the 14th century. [1] [nb 1] Like the suanpan, the soroban is still used today, despite the proliferation of practical and affordable pocket electronic calculators .

and the top deck one is worth 5. Moving up 1 bottom deck bead increases by 1 the number represented in the column.

Japanese Abacus (Soroban) - alcula

I have always been fascinated by the abacus – and have recently taken up the study of this tool. I have practiced on both a Chinese Abacus (called a Suan Pan) and on a Japanese Soroban. The modern Chinese abacus has been in use since about the 14th century. The Japanese Soroban has been in use since at least the 16th century.

Japanese Abacus Simulator (Soroban)
During the Japanese Edo period (1603 –
1868 CE), the most common tool for cal-
culation was the Japanese bead abacus
known as the soroban 算盤. This device was
used by merchants, farmers, and
mathematicians alike to calculate everything
from the cost of exchanging silver into gold
to calculating the value of π . In this article,

A while ago I posted about making a homemade soroban for my kids out of a Melissa & Doug abacus. The bead size of a traditional abacus was just too small to be truly effective for my son, age 3. My daughter did alright with a small abacus, but in general bigger is still better with my kids while they are young. It makes the learning more "obvious."
