If two Visual Basic objects from the same project are running in different STAs, they see a separate instance of each BAS-module variable. With MTS, you should assume that every activity runs in a separate STA. This means that Visual Basic alone doesn't provide a reasonable way to share data across objects running in separate MTS activities.

Programming with Visual Basic lies in the fact that the Visual Basic programming environment is designed to hide as many low-level system details as possible. While this approach can speed development time by letting you focus on the task at hand, it actually hinders the process when it obscures details you need to understand or control.

When you install your DLL with the MTS Explorer, MTS automatically configures your components with the appropriate transaction support attributes. The person installing a DLL created with Visual Basic 6 in an MTS package doesn't have to set these attributes by hand, as is the case with DLLs created with Visual Basic 5. Figure 10-4.

You create MTS components with Visual Basic by adding public MultiUse classes to an ActiveX DLL. Be sure you leave the threading model of your ActiveX DLL project set to the default, which is Apartment Threaded. After building your DLL, you can install it in the MTS run-time environment using the MTS Explorer.
