In the first calling sequence, an animation with 25 frames is created for 25 equally spaced real values of the animation parameter A on the range $a..b$. In the second calling sequence, the given list of values is used for frames of the animation. The first input, `plotcommand` is the Maple plotting command. It must return a Maple 2-D or 3-D plot.

The `odeplot` function plots or animates one or more solution curves (either 2-D or 3-D) obtained from the output (`dsn`) of a call to `dsolve/numeric`. Note: If you are using the `output=piecewise` option with `dsolve/numeric`, you should use the `plot` function to plot or animate your solution.

Given an ODE system, possibly including algebraic constraints and inequations, `dsolve` returns an exact solution when: 1) it succeeds in uncoupling the system and 2) `dsolve`'s routines for solving a single ODE succeed in solving each of the ODEs arising in the uncoupling process. Depending on the complexity of the system, step 2) may not be fully successful.

dsolve - Maple Programming Help

Obtaining the Exact Solution of a First Order ODE We can take an initial condition into account using Maple and determine an exact solution that depends on the initial condition. Solving an ODE that has an initial condition is again done using the `dsolve` command.

Analytical Solutions of PDEs using PDEtools in Maple
Additionally, care must be taken when choosing integral transform methods to obtain a solution to an ODE or ODE system. For example, use of fourier-type transforms for problems with polynomial coefficients may require the solution of another differential equation of higher differential order (see example below).

Notice that a quick glance at the direction field let's us predict how the solutions will behave. Before proceeding, print a copy of the above direction field, and sketch the solution for which $y(0)=1$. Be sure to consider negative t as well as positive. Also sketch the equilibrium solutions. How to print the direction field:

Next, create a stop-motion animation object of the first pendulum bob by using the `fanimator` function. By default, `fanimator` creates an animation object with 10 generated frames per unit time within the range of t from 0 to 10. Plot the coordinates by using the `plot` function. Set the x-axis and y-axis to be equal length.

The Maple commands are so intuitive and easy to learn, students can learn what they need to know about the software in a matter of hours - an investment that provides substantial returns. Maple's animation capabilities allow students and practitioners to see real-time displays of the solutions of partial differential equations.
