Two of these - calculations involving reacting quantities (or moles) and calculations involving reaction rates are ones that you'll have come across at GCSE. The last one - the idea of reactions at equilibrium - is an idea you may have seen at GCSE, but you've yet to put numbers into the idea. So why do chemists use maths?

k in the equation: $\text{Rate} = k [A]^n$ that determines how quickly a reaction will occur at a constant concentration of reactant.

Equilibrium constant. The ratio of $[\text{Products}] / [\text{Reactants}]$ at equilibrium that determines the relative concentrations of each at the equilibrium position.
