The protist kingdom includes protozoa and algae. (Two groups of fungi with similar characteristics to protozoa, myxomycetes and oomycetes, have been classified as protists.) Unicellular protozoa and algae are unicellular eukaryotes. Pluricellular algae are also eukaryotes of simple structure. Protists are believed to be the phylogenetic ancestors of the living organisms of the other eukaryotic kingdoms (fungi, animals and plants).

Protist - Protist - Means of locomotion: One of the most striking features of many protist species is the presence of some type of locomotory organelle, easily visible under a light microscope. A few forms can move by gliding or floating, although the vast majority move by means of “whips” or small “hairs” known as flagella or cilia, respectively.

Protists are microscopic unicellular organisms that don't fit into the other kingdoms. Some protists are considered plant-like while others are considered animal-like. The animal-like protists are known as protozoans. The amoeba is considered an animal-like protist because it moves and consumes its food. Protists

### *Protists Worksheet - Biology by Napier*

Protists - The Protozoans. Five pages provide thorough coverage of three protozoans: euglena, amoebae, and paramecia. For each, junior biologists read factual text, label the organism, and write answers to several questions. This neatly organized assignment is five pages long and makes an ideal preparation for examining these protists in the laboratory.

The animal-like protists have traditionally been called "protozoans". They are heterotrophic and usually have structures for motility. Plant-like protists are autotrophic and capable of photosynthesis. Many of them are floaters, with no structures for motility. Protists are among the largest of all eukaryotic cells.
