A theorem that helps us find a missing side of a triangle; Pythagorean theorem, also known as Pythagoras' theorem. The theorem provides a fundamental relationship between the base, height, and hypotenuse of a triangle. It is given by the equation; $(\text{Hypotenuse})^2 = (\text{Base})^2 + (\text{Height})^2$ The hypotenuse is always the longest side of the triangle. After reading the problem, always start by creating a diagram.

According to the definition of the Pythagorean theorem, the formula would be written as: $c^2 = a^2 + b^2$. Pythagorean theorem allows us to find the length of a side when two lengths are known, making it a useful technique in navigation and construction. When we have two known sides, we can easily find out the length of the diagonal.

Can I use the Pythagorean theorem with any triangle? The Pythagorean theorem is unique and true only to triangles with a 90-degree angle. If you have a non-right triangle, you will have to resort to using the Cosine Law to solve for the missing values. The equation summarizes the Cosine Law is as follows: $c^2 = a^2 + b^2 - 2ab \cos(C)$, where C is the angle opposite to the hypotenuse.
