A simple turbojet engine was designed and construction was begun. The design was made by studying the work done by industry and researchers over the course of the history of jet engines. The methods were then discussed and chosen in a way that would simplify the design work as well as the construction of the engine.

Design and construction of a simple turbojet engine

Evolution of turbojet engines to the technology level of today • new concepts or technological breakthroughs are rare; • advancements are rather due to evolutionary improvements of the design To achieve good performances, parallel research and development effort were undertaken in areas such as in aerodynamics,

Mechanical Design of Turbojet Engines - An Introduction

The Teledyne CAE J402 is a small turbojet engine. Several variants have been developed to power unmanned air vehicles such as missiles and target drones. Developed in the 1970s for the Harpoon anti-ship missile, the J402 was the first jet engine to be designed as a "wooden round", meaning that the engine had to be able to sit for long periods without maintenance or inspection and work right away.

Teledyne CAE J402 - Wikipedia

For aircraft jet propulsion there are in general four distinct designs: the turbojet, turbofan (or bypass engine), turboprop and turboshaft. This post will address the layout and design of the two most common engines used in modern aircraft, the turbojet and turbofan, and explain how their characteristics make each engine applicable for a specific task.

design, and test them in control of a small turbojet engine in order to determine the resulting control efficiency. The aim, and the expected scienti?c contribution, was to research and identify the methods and approaches that will be suitable and applicable in developing digital control systems for this class of turbojet engines.

Robust Control of Small Turbojet Engines

The PBS TJ150 jet engine was developed for manned and unmanned vehicles (UAVs). Its advantage is its compact design, low weight with a thrust of up to 1,500 N, and low fuel consumption in the given power category. The generator output is 750 W. One of the PBS TJ150 engine versions enables landing on water.

PBS TJ80 is a small turbojet engine that has been designed for manned and unmanned vehicles. Single-stage radial compressor, radial and axial diffuser, annular combustion chamber, and single-stage axial turbine. Rotor bearings are lubricated by the autonomous oil system. The engine is controlled by an electronic system.

Cut a 3" length of 5/8" stainless steel rod. Orient the 3" section vertically in a vise or clamp, and use a drill press with a 1/4" bit to drill all the way through the length of rod. On one end of the rod, use a 3/32" drill bit to drill multiple small holes horizontally through it.

How to Build a Jet Engine! : 14 Steps (with Pictures ...

In a jet engine we use the energy extracted by the turbine to turn the compressor by linking the compressor and the turbine by the central shaft. The turbine takes some energy out of the hot exhaust, but there is enough energy left over to provide thrust to the jet engine by increasing the velocity through the nozzle.

The General Electric J85 is a small single-shaft turbojet engine. Military versions produce up to 2,950 lbf of thrust dry; afterburning variants can reach up to 5,000 lbf. The engine, depending upon additional equipment and specific model, weighs from 300 to 500 pounds. It is one of GE's most successful and longest in service military jet engines, with the civilian versions having logged over 16.5 million hours of operation. The United States Air Force plans to continue using the J85 in aircraft

General Electric J85 - Wikipedia

While the turbojet was the first form of gas turbine powerplant for aviation, it has largely been replaced in use by other developments of the original concept. In operation, turbojets typically generate thrust by accelerating a relatively small amount of air to very high supersonic speeds, whereas turbofans accelerate a larger amount of air to lower transonic speeds. Turbojets have been replaced in slower aircraft by turboprops because they have better specific fuel consumption. At medium speed

How to build a "TURBO-JET ENGINE" from easy to find ...

A very important parameter when designing jet engines is specific power - the amount of power output divided by the mass of the engine. In general, a good heuristic to keep in mind when designing anything that moves is that maximising the power output per unit mass leads to a more efficient design. Afterburning is an exception to this rule.

The idea of utilizing small turbojet engines for rapid prototyping of algorithms and construction has also been pursued by other authors, Pecinka and Jilek designing a cost-effective test cell for small turbojet engines [6], application of small turbojet engines in education described in the works [7, 8

Intelligent Situational Control of Small Turbojet Engines

The PBS TJ150, with a maximum thrust of 1,500 N, is the most powerful turbojet engine produced by PBS. It was originally designed based on the PBS TJ100 (PBS's most well-known and popular turbojet engine), utilizing the same outer diameter measurements and engine weight but with a slightly more compact body frame and 20% more power.
