~~The Stars Were Right - K. M. Alexander~~

Star - Star - Distances to the stars:

Distances to stars were first determined by
the technique of trigonometric parallax, a
method still used for nearby stars. When the
position of a nearby star is measured from
two points on opposite sides of Earth's orbit
(i.e., six months apart), a small angular
(artificial) displacement is observed
relative to a background of very remote
(essentially ...

~~History of Stars — Universe Today~~

Barnard's star, second nearest star to the Sun (after the triple system of Proxima Centauri and Alpha Centauri's A and B components considered together), at a distance of 5.95 light-years. It is named for Edward Emerson Barnard, the American astronomer who discovered it in 1916. Barnard's star has the largest proper motion of any known star—10.39 seconds of arc annually.

~~Barnard's star | Distance, Facts, & Planet | Britannica~~

The Sun is a star 150 million km from Earth and has a diameter of 1 390 000 km. The nearest star to the Sun is Proxima Centauri and is 4.3 light years from Earth. Stars can be different colours,...

Specific fixed stars Aldebaran.
Astrologically, Aldebaran is a fortunate star, portending riches and honor. This star, named "Tascheter" by the Persians, is one of the four "royal stars" of the Persians from around 3000 BC. These stars were chosen in such way that they were approximately 6 hours apart in right ascension. Each of these stars was assigned to a season, Aldebaran was prominent in the ...

~~Stars in astrology — Wikipedia~~

A rectangle of four bright stars outlines his body, with his three-star belt at the rectangle's center. The belt points toward Sirius, the brightest star in the night sky. Other bright sights include the twins of Gemini, yellow-orange Capella high overhead, and the V-shaped face and orange eye of Taurus.
