Vectors and Projectiles 5. The diagram below shows the trajectory of a horizontally launched projectile. Positions of the projectile at 1-second intervals are shown. Demonstrate your understanding of the components of the displacement vector by determining the horizontal displacement (x) and the vertical displacement (y) after the fifth second. x = 250 m. right y = 125 m, down 6.

Answers to questions #15-#18: 15. B. 16. A. 17. E. 18. G. Vectors are added by a head-to-tail method and the resultant is drawn from the tail of the first vector to the head of the last vector. So if two vectors are added - say B is added to A (as in $A + B$) - then first A is drawn and the tail of B is placed at the head of A.

Vectors can be represented by an arrow on a scaled diagram; the length of the arrow represents the vector's magnitude and the direction it points represents the vector's direction. Answer: AD. a. TRUE - Vectors are defined as quantities which are fully described by both their magnitude and direction. By definition, a vector has a direction ...

Once v_{ix} and v_{iy} are known, the other unknowns can be calculated. The time up to the peak (t_{up}) can be determined using the equation. $v_{fy} = v_{iy} + a_y * t$. where the $v_{fy} = 0$ m/s (there is no vertical velocity for a projectile when its at its peak) and $a_y = -10$ m/s/s. Once t_{up} is known, the t_{total} (time to travel the entire trajectory -both up and down) can be determined by doubling the ...

Vectors and Projectiles 3. A component is the effect of a vector in a given x- or y- direction. A component can be thought of as the projection of a vector onto the nearest x- or y-axis. SOH CAH TOA allows a student to determine a component from the magnitude and direction of a vector. Determine the components of the following vectors. $12m \cos \dots$

~~Mellon, Jeffrey / Unit 3—2D Projectile Motion~~

Answer: D. For projectiles launched at angles, a launch angle of 45 degrees will provide the largest horizontal displacement. Any two launch angles which are separated from 45 degrees by the same amount (for example, 40 degrees and 50 degrees, 30 degrees and 60 degrees and 15 degrees and 75 degrees) will provide the same horizontal displacement.

Vectors and Projectiles The Equations: Kinematic equations used for 1-dimensional motion can be used for projectile motion as well The physics classroom 2009 answer key vectors and projectiles. The key to their use is to remember that perpendicular components of motion are independent of each other. As such, the equations for one dimension must be applied to either the horizontal motion of a ...

~~The Physics Classroom 2009 Answer Key Vectors And Projectiles~~

The Vector Guessing Game will challenge learner's understanding of adding vectors. Two random vectors are displayed and learners must decide on the size and direction of the resultant. Be quick because the timer is counting down. The challenge is to solve as many correctly as possible in 20 seconds. Repeat the process and beat your high score.

~~Physics Simulations: Vectors and Projectiles~~

Answer: See answers above. Vectors are added by a head-to-tail method and the resultant is drawn from the tail of the first vector to the head of the last vector. So if two vectors are added - say B is added to A (as in $A + B$) - then first A is drawn and the tail of B is placed at the head of A.
