Vinyl chloride (VCM) is a colourless, toxic, flammable, and carcinogenic gas with a sweet odor. It is almost exclusively used for the production of polyvinyl chloride. Polyvinyl chloride (PVC) is one of the most important commodity polymers. After polyethylene (PE) and polypropylene (PP), polyvinyl chloride (PVC) is among the top 3 resin types.

Vinyl chloride (VCM) and Polyvinyl chloride (PVC ...

The solubility of vinyl chloride monomer (VCM) in PVC powders has been studied by equilibrium vapor pressure and microbalance gravimetric techniques at temperatures from 30 to 110°C.

The solubility of vinyl chloride in poly(vinyl chloride ...

Vinyl chloride is an organochloride with the formula $H_2C=CHCl$ that is also called vinyl chloride monomer (VCM) or chloroethene. This colorless compound is an important industrial chemical chiefly used to produce the polymer polyvinyl chloride (PVC). About 13 billion kilograms are produced annually.

Vinyl chloride - Wikipedia

Vinyl chloride (VCM), which is made from ethylene and chlorine, is used as feedstock in the production of the standard plastic material PVC. The market for PVC and hence VCM has continued to grow, thus dispelling the fore-casts made in the 80s, according to which PVC would be substituted by other plastics. The reasons for this were not only the mani-

Vinyl chloride and polyvinyl chloride

In the early 1970s, the carcinogenicity of vinyl chloride (usually called vinyl chloride monomer or VCM) was linked to cancers in workers in the polyvinyl chloride industry. Specifically workers in polymerization section of a B.F. Goodrich plant near Louisville, Kentucky, were diagnosed with liver angiosarcoma also known as hemangiosarcoma, a rare disease. [53]

Polyvinyl chloride - Wikipedia

Vinyl Chloride Monomer (VCM) is a colorless, flammable gas at room temperature. Its chemical formula is C_2H_3Cl . It is primarily used to manufacture polyvinyl chloride (PVC), a very stable, non-flammable, lightweight and durable plastic. PVC is used in a variety of applications. For example, it is found in common building products such as PVC pipe and window frames.

Yeah, even many books are offered, this book can steal the reader heart suitably much. The content and theme of this book really will lie ...

Vinyl Chloride Vcm And Polyvinyl Chloride Pvc

Polyvinyl Chloride (PVC) A major thermoplastic material with a very wide variety of applications, the essential materials for polyvinyl chloride are derived from oil and salt. The vinyl chloride monomer (VCM) is formed by combining ethylene (obtained from oil) with Chlorine (produced from the electrolysis of salt water). VCM molecules are polymerized to form PVC resin, to which appropriate additives are incorporated to make a customized PVC compound.

Vinyl Chloride Monomer (VCM) Vinyl Chloride Monomer (Formula : C_2H_3Cl) is produced by cracking EDC in PFR furnace. This colorless compound is an important industrial chemical chiefly used to produce PVC. VCM is a gas with a sweet odor, flammable, and highly toxic.

Vinyl Chloride Monomer (VCM) - Sulfindo

Vinyl chloride was first produced in 1835 but did not go into regular production until the early twentieth century. Vinyl chloride has been used in the past as an anaesthetic and as an aerosol spray propellant but its principle use has been to produce the polymer, polyvinyl chloride (PVC), or vinyl.

MSDS Vinyl Chloride Monomer (VCM)

Polyvinyl Chloride (PVC) Polyvinyl Chloride (Formula : $C_2H_3Cl_n$) is a synthetic resin made from the polymerization of VCM in batch reactor. PVC comes in two basic forms: rigid and flexible. It is very durable and long lasting material which can be used in a variety of application.

CDC - NIOSH Pocket Guide to Chemical Hazards - Vinyl chloride

Vinyl chloride monomer (VCM) is one of the world's most important and largest commodity chemicals. VCM is used primarily for the production of polyvinyl chloride (PVC) homopolymer and copolymer resins.

Vinyl Chloride Monomer (VCM) - Chemical Economics Handbook ...

Vinyl chloride is the starting material for the production of polyvinyl chloride, used in the fabrication of products such as PVC pipe. The mutagenicity of this liver carcinogen is dependent on metabolic activation by CYP450, and detoxification is mediated by mEH. 18 As shown in Figure 7-6 , vinyl chloride is a relatively simple compound.

Vinyl Chloride - an overview | ScienceDirect Topics

The electrolysis of salt water produces chlorine, which is combined with ethylene (obtained from oil) to form vinyl chloride monomer (VCM). Molecules of VCM are polymerised to form PVC resin, to which appropriate additives are incorporated to make a customised PVC compound. The PVC production process consists of 5 steps:

Polyvinyl Chloride PVC: Properties, Benefits & Applications

Vinyl chloride is used primarily (> 95%) in the manufacture of polyvinyl chloride (PVC), which comprises about 12% of the total use of plastic worldwide (WHO, 1999). The largest use of PVC is in the production of plastic piping. Other important uses are in floor coverings, consumer goods, electrical applications and in the trans- port sector.
