Digital Modulation. The above examples show the use of Amplitude and Frequency Modulation to carry an analog signal. Analog signals consist of the raw information and do not relate to digital 1s and zeros. A constellation diagram is used to relate discrete digital values to different changes in the analog carrier.

In MODEM, modulator converts digital information into analog audio tones (or Radio frequency signal) and demodulator does reverse. Modulation Functions. Following are the main functions of modulation techniques.

- It is used to convert digital information into analog form suitable to be transported between two points in a wired/wireless system.

A demodulator is an electronic circuit that is mainly used to recover the information content from the modulated carrier wave. There are different types of modulation and so are demodulators. The output signal via a demodulator may describe the sound, images, or binary data.

What is Modulation and Demodulation? - Definition, Types ...
Digital Modulation. In most media for communication, only a fixed range of frequencies is available for transmission. One way to communicate a message signal whose frequency spectrum does not fall

Digital Modulation - MATLAB & Simulink

In digital communications, chirp spread spectrum (CSS) is a spread spectrum technique that uses wideband linear frequency modulated chirp pulses to encode information. A chirp is a sinusoidal signal of frequency increase or decrease over time (often with a polynomial expression for the relationship between time and frequency). In the picture is an example of an upchirp in which the frequency ...
