There is a criss-cross method to write chemical formula of compounds. The method is given below: We first write the symbols of the elements which form the compound. Below the symbol of each element, we write down its valency. Finally, we cross over the valencies of the combining atoms. That is, with the first atoms we write the valency of second atom (as a subscript); and with the second atom we write the valency of first atom (as subscript).

In chemistry, the criss-cross method is a way to write the formulas of ionic compounds. The criss-cross method makes it easier to determine the subscripts for each element in an ionic compound. Using this method, the number associated with the charge of the first ion is assigned as the subscript of the second ion.

The criss-cross method of balancing charge! Ionic compound formulas must contain the fewest number of ions that "balance" out positive and negative charge (the same amount of each). The "criss-cross" method is one way of writing the formulas properly. The formula for ionic compounds is called a "formula unit."

The crisscross method is a way to determine the chemical formula of compounds by using the valence of the atoms. Atoms have a central core of protons and neutrons, with layers of electrons circling the core in layers called shells. The outermost shell may contain too many or few electrons, which is described by a plus or minus valence number.
